

COLIFAST®

SUMMER NEWSLETTER 2018

Read more about:

- Stian, our energetic, honey-producing new co-worker!
- Sara Recabal and Roger Goh – our new distributors from Chile and Singapore
- The latest Colifast ALARM installation on raw water basin

We finally found the perfect candidate!

Stian, a newly graduate from UiO has been employed as Colifast's new Instrument technician & Sales manager. The bee-keeper from Nesodden brings a new voice to the table and honey for lunch. With a background in molecular biology and an interest for technical instrumentation, Stian is a good candidate for the job. And we love the honey!

Distributor news

We had a great visit from Chile!

In June our newly appointed distributor in Chile, Sara Lagos, came to visit us in Oslo for technical distributor training. The training took place in our laboratory at Lysaker as well as in the field, visiting customer installations for real hands on training. In the evening Norwegian was on the menu and we also found time for a little sightseeing before Sara left to participate the big fair Achema in Germany.

Colifast products now available in Singapore

Colifast AS proudly presents Asia Technology Engineering Pte Ltd as our distributor in Singapore. Please visit their website www.ate.com.sg for further information or contact Roger Goh, roger.goh@ate.com.sg.

We strongly recommend all our distributors to visit us for technical training and socializing every now and then. Please contact us for available dates and accommodation recommendations.

Colifast Distributor training seminar 2019

In February/March 2019 we will arrange our distributor seminar, where we combine technical training and skiing in the mountains. Please contact us if you are interested in participating as soon as possible. There is limited capacity. The official invitation will be sent out in September.

Colifast ALARM installation in suburban Oslo

Just before Christmas the municipality of Bærum came to the conclusion that daily online monitoring of the bacterial quality on their cleanwater basin was needed. Their concern was that cracks in the solid rock surrounding the basin might allow water to seep in bringing with it contamination from the outside. Having data on when, if such contaminations occurs, might help improve decision making with regards to safety measures. The online features of the Colifast instrument also serves Bærum well as the localization of the facility is somewhat remote.
